PR 65 Research Interviews

Recommendation Snapshot

Add to Backlog

Duplicate data entry points

- As a docket clerk, I need to update petitioner and caption information in a single location to prevent errors and speed up my workflow.

As a docket clerk, I need to flexibility to copy petitioner updates to the case caption or to manually update the case caption for maximum flexibility and error prevention.

Multiple Petitioners in a Case

- As an admissions/docket clerk, I want all single and multi-petitioner information located in the same area of the application
- As an admissions/docket clerk user, I want petitioner types to be flexible and easily identifiable so I can add multiple different types when needed

Case Notes

- As a docket clerk, I want notes to be better integrated into my process workflow so that I am aware of critical case information.

Investigate

eAccess Process Issues

- Investigate the petitioner experience and reconcile with the internal user feedback
- Define the eAccess user journey and identify opportunities for improvement for more direct action

Work Prioritization & Processes

- Further investigate how they currently prioritize work with targeted observations
- Investigate Document QC Inbox sorting, and build trust with docket that sorting is correct (or consider adding the trial session date visible in the Inbox)
- Revise / reprioritize user story for "quick win" - story for high priority messages #1432

User Customization

- Further investigate how different user groups view and use case information during their workflows through targeted observations (docket clerk, ADC, ...)

Watch

Remote Work Challenges

- Consider adding criteria to DoD for designing for on-site and remote work (i.e. laptops, single monitor, poor internet connection)
- Ensure user observations include participants who work both on-site and remotely (when on-site work resumes)

eAccess Process Issues

Investigate

Recommendation

- Investigate the petitioner experience and reconcile with the internal user feedback

- Define the eAccess user journey and identify opportunities for improvement for more direct action

Problem Statement

There are several touchpoints to get accounts set up, with as many opportunities to introduce errors.

Summary of Findings

Admissions clerks serving as help desk support spend an inordinate and unnecessary amount of their time dealing with eAccess issues related to the registration process. Many of these issues stem from user misunderstandings around passwords, time limitations (7 days) around email verification, and IE usage.

Petitioners are consistently mistyping or copying the system-generated passwords, frequently due to them containing special characters that users can't distinguish from punctuation. Similarly, petitioners do not understand that usernames are case-sensitive, causing additional login issues. The instructions to petitioners is failing at properly preventing user errors, and the error recovery is a cumbersome, manual process.

Because petitioners are having trouble with this process, clerks are doing things for them that are outside the scope of their roles, presenting some security risks.

How Might We?

How might we make the initial onboarding less confusing?

Temporary passwords in the onboarding email for eAccess are difficult to use

Comprise temporary passwords using criteria users would know (Chelsea0000)

Allow users to request new temporary password online

Do we even need to use a temporary password at all?

Why does the password policy exist as it does? What would need to happen to change it (for temporary ones)?

Just ask them to verify the email and then they set up their password

Can the process be the same as the new user set up process?

Can we pass credentials through to the URL?

Why is there a 7 day timeout?

Duplicate date entry points

Add to Backlog

Recommendation

Consider creating a user story for the backlog (example below):

1. As a docket clerk, I need to update petitioner and caption information in a single location to prevent errors and speed up my workflow.
2. As a docket clerk, I need to flexibility to copy petitioner updates to the case caption or to manually update the case caption for maximum flexibility and error prevention.

Problem Statement

Requiring clerks to enter duplicative data introduces unnecessary risk of errors and doubles the amount of time to complete a change.

Summary of Findings

Clerks must change the same information in multiple places when updating petitioner information (i.e. caption and petitioner name).

This redundant data entry is required every time petitioner name changes, a petitioner is added to the case, a petitioner is removed from the case, and for any other reason ordered by the Court.

Clerks have become accustomed to this redundancy as part of their workflow.

How Might We?

How might we eliminate redundant data entry?

make changes for user that affect other case details

How much can we pre-populate?

Can we introduce 'shortcodes'?

builds caption based on petitioner information

elect to copy petitioner changes

manually updates case caption in same form as petitioner updates

Multiple Petitioners in a Case

Add to Backlog

Recommendation

Consider creating a user story for the backlog (example below):

1. As an admissions/docket clerk, I want all single and multi-petitioner information located in the same area of the application
2. As an admissions/docket clerk user, I want petitioner types to be flexible and easily identifiable so I can add multiple different types when needed

Problem Statement

Clerks need the ability to manage petitioners (add/remove/edit). They are also confused about where to find information on certain types of parties (intervenors, etc.)

Summary of Findings

Clerks need to add subsequent types of petitioners to cases. The system includes other petitioner information already, but clerks do not know where to find this information now, much less where to add additional petitioners with varying types (intervenors, participants, etc.) in the future.

How Might We?

How might we make managing petitioners easier?

what is the level of understanding around secondary petitioners?

decide on definiton and process handling for secondary petitioners

consolidate all petitioner information into one location (Petitioner tab)

Label petitioners?

Type = Petitioner, Intervenor, Participant, etc.

Is there a problem with the IA?

Case Notes

Add to Backlog

Recommendation

Consider creating a user story for the backlog (example below):

1. As a docket clerk, I want notes to be better integrated into my process workflow so that I am aware of critical case information.

Problem Statement

As an docket clerk, I want notes to be better integrated into my process workflow

Summary of Findings

When viewing case information, important information is sometimes saved in the case notes.

Clerks do not regularly view the case notes on each case (lack of visibility, competing mental priorities) and are missing critical information needed for their decision-making.

How Might We?

How might we better convey the value of notes?

Notes are a critical part in the workflow, their heirarchy should reflect this

raise Notes in visual hierarchy (currently it is equal to all other tabs)

default to Notes tab

visual indicator of notes (similar to Tracked Items)

Work Prioritization & Process

Investigate

Recommendation

- Further investigate how they currently prioritize work with targeted observations
- Investigate Document QC Inbox sorting, and build trust with docket that sorting is correct (or consider adding the trial session date visible in the Inbox)

- Revise / reprioritize user story for "quick wins" (see examples)

1. As a Court user, in order to easily identify items that are high priority and need immediate attention, I need a high priority indicator on certain messages in my work queues. (#1432)

Open link

Problem Statement

Docket clerks need a better way to prioritize their work across multiple queues.

Summary of Findings

Being able to accurately prioritize their work is critical for clerks, and the current framework of QC work items and messages is failing at giving them the prioritization they need to best organize their work for the day.

Clerks need items to be sorted in the Document QC Inbox by high priority items sorted by the trial date, but they do not understand or trust this sorting.

How Might We?

How might we better define process workflow?

As an admissions/docket clerk, I want a sense of order when it comes to my daily work within the application

add trial session date to case status column - "Calendared 4/12/21"

Dashboard with both QC and messages

also next steps?

Message prioritization (quick win)

User Customization

Investigate

Recommendation

- Further investigate how different user groups view and use case information during their workflows through targeted observations (docket clerk, ADC, ...)

Problem Statement

As a court employee, I need to be able access case information in a way that compliments my workflows.

Summary of Findings

When learning the new system, clerks were challenged by the deep navigation structure within cases and had trouble locating information that had been readily available to them in the legacy application.

Different user groups find different case information more valuable, and the one-size-fits-all solution in place increases the learning curve and the time users spend finding information.

How Might We?

How might we make common tasks more easily accessible?

How might we remove unnecessary layers of abstraction?

are the tabs in the right order?

customizable tab order

customizable "Favorites" bar

multiple access points for information / actions

customize my top case actions in order to more easily access them within a case and save time.

Remote Work Challenges

Watch

Recommendation

- Consider adding criteria to DoD for designing for on-site and remote work (i.e. laptops, single monitor, poor internet connection)

- Ensure user observations include participants who work both on-site and remotely (when on-site work resumes)

Problem Statement

Remote work is requiring users to work in unexpected environments with inconsistent (and possibly unreliable) device setups that were not intended or known when the application was designed.

Summary of Findings

Clerks are working remotely and do not have uniform workspaces in their homes.

Clerks without dual monitors must tab back and forth through screens to view and enter information, essentially using the system in an environment and device configuration it was not intended for.

How Might We?

How might we make remote and on-site experiences more equivalent?

allow for multiple or custom display setups?

make remote and on-site experiences equivalent?

ensure clerks can easily complete their work with a single display?

internal bookmarks

window/card docking?
